

**The Problem: Bouncing Arms**  
 are a common problem among tarp systems in our industry. This causes damage to arms, tailgates and allows pay load to escape.

## The Solution: The Claw™

### Stops Premature Wear to Your Dump and Tarp System

The Claw™ is exclusive to Aero® Easy Cover® systems. It is simple, affordable and effective – utilizing two mechanical hooks integrated onto the cross arm of the tarp system. The Claw tarp arm hold down eliminates arm and tarp bouncing by securing the arms tightly against the tailgate.

- Easy to install
- No electrical components

The tarp system operates as normal...

...as the dump body is covered...

...the Claw automatically latches into place, securing the arms tightly against the tailgate.

## The Problem: Blowing Tarps

As the wind blows your tarp, you lose money. When transporting pay load at high speeds the wind causes lift on your tarp. This puts strain on the tarp system and allows pay load to escape.

## The Solution: Easy Cover® Double-Arm System

- Second arm helps hold tarp inside body, minimizing tarp lift and blowing
- Simple design – no mechanical parts – gravity is used to secure tarp
