Series Spring

New Series Spring Assembly

• The Series Spring has enough torque in the covered position to keep the arms from lifting and bouncing.

• Series Spring is designed for optimal tension on the tailgate in the high mount position. This spring system can be mounted high or low on the dump body.

• Springs are active in providing torque for 280° of rotation. Two sets of springs work together in series to double the range of motion from 140° to 280°.

Eliminate Arm Bounce with 280° of Torque
